The material consists of (A) a continuous phase of a polyphenylene ether(s) and (B) a dispersoid phase consisting of (1) a dispersed polyolefin(s) of a minor axis of practically up to 0.5 micron on which one or more of vinyl aromatic-conjugated diene copolymers and their hydrogenated prods. are aggregated and (2) one or more of the copolymers of a minor axis of practically up to 0.3 micron dispersed in simple form.

USE/ADVANTAGE - Owing to the finely dispersed structure contg. the polyolefin(s) and compatibiliser(s), the material has reduced layer peelability, high weld strength and good sliding characteristics, esp. high resistance to friction and wear.

In an example, polyphenylene ethers include poly(2,6-dimethyl-1,4-phenylene ether), poly(2-methyl-6-ethyl-1,4-phenylene ether) and poly(2,6-dichloro-1,4-phenylene ether). Polyphenylene ether copolymers are also available, including poly(2,6-dimethyl-1,4-phenylene ether)-2,6-dimethylphenol-2,3,6-trimethylphenol copolymer. The vinyl aromatic cpd. for the compatibiliser is pref. one or a mixt. of styrene, alpha-methylstyrene, vinyl toluene, p-tert.-butyl styrene and/or diphenyl ethylene.
